Contents

1	Introduction to optimization	3
1.1	Notations and definitions	3
1.2	Examples	3
1.2.1	Example 1: linear problem	3
1.2.2	Example 2: least squares problem	4
1.2.3	Calculus of variations	4
1.2.4	Example 3: optimal trajectory	4
1.2.5	Example 4: geodesic	5
1.2.6	Other examples	5
2	Optimality conditions	7
2.1	Fréchet and Gâteaux differentiability	7
2.2	Convexity and Gâteaux differentiability	9
2.3	Optimality conditions	11
2.3.1	First-order necessary optimality conditions	11
2.3.2	Convex case: sufficient optimality conditions	12
2.3.3	Second-order optimality conditions	13
3	Existence of a minimum	15
3.1	Existence of minima in finite dimension	15
3.2	Infinite dimension	15
3.2.1	Convex analysis: existence of a minimum in a Hilbert space	15
3.2.2	Application to quadratic functions:	15
3.2.3	Weak convergence	16
3.2.4	Lower semicontinuous functions and epigraphs	16
3.2.5	Proof of the existence of a minimum in a Hilbert space	17
4	Lagrange multipliers and duality for constrained optimization	19
4.1	Minimization under equality constraints	19
4.2	Saddle points	19
4.2.1	Definition	19
4.2.2	Inequality constraints	20
4.3	Convex optimization: the Kuhn-Tucker theorem	20
4.4	Duality	21

5	Optimization algorithms	23
5.1	Unconstrained optimization	23
5.1.1	Gradient algorithm with fixed step	23
5.1.2	Gradient algorithm with optimal step	24
5.1.3	Conjugate gradient	25
5.2	Constrained optimization	26
5.2.1	Gradient algorithm with projection	26
5.2.2	Identification of a saddle-point: Uzawa's algorithm	27
