Abstract

We consider the system of isothermal Euler Equations with a strong damping. For large $BV$ solutions, we show that the density converges to the solution to the heat equation when the friction coefficient $\varepsilon^{-1}$ tends to infinity. Our estimates are already valid for small time, including in the initial layer. They are global in space (and even in time when the limits of the density are the same at $\pm\infty$) and they provide rates of convergence when $\varepsilon \to 0$.

1 Statement of the results

In this paper, we consider the flow of a compressible fluid through a porous medium, namely the Euler system with damping, written here in the one-dimensional case

\begin{align}
\frac{\partial \rho(\varepsilon)}{\partial t} + \frac{\partial}{\partial x} (\rho(\varepsilon) u(\varepsilon)) &= 0, \\
\frac{\partial}{\partial t} (\rho(\varepsilon) u(\varepsilon)) + \frac{\partial}{\partial x} (\rho(\varepsilon) (u(\varepsilon)^2 + p(\rho(\varepsilon)))) &= -\frac{\rho(\varepsilon) u(\varepsilon)}{\varepsilon}.
\end{align}

(1.1)

(1.2)

In this model, $\rho(\varepsilon)$ is the density, $u(\varepsilon)$ is the velocity, $p$ is the pressure and $\varepsilon^{-1}$ the friction coefficient. In the isothermal case, the pressure is given by:

\[ p(\rho) = \rho. \]

(1.3)

We consider the problem (1.1), (1.2), (1.3), with the initial data :

\[ \rho(\varepsilon)(0, x) = \rho_0(x), \quad u(\varepsilon)(0, x) = u_0(x). \]

(1.4)

We assume that the initial data are $BV$ functions, i.e. functions with bounded variation, and satisfy :

\[ \inf_{x \in \mathbb{R}} \rho_0(x) \geq \rho_{\text{min}} > 0, \quad \rho_{\pm \infty} = \lim_{x \to \pm \infty} \rho_0(x), \quad u_{0, \pm \infty} = \lim_{x \to \pm \infty} u_0(x). \]

(1.5)
In this paper we consider $L^1$ perturbations of Riemann data:

$$ (\rho_0 - \bar{\rho}_0, u_0 - \bar{u}_0) \in L^1(\mathbb{R}), \quad \text{where } (\bar{\rho}_0, \bar{u}_0)(x) := (\rho_{\pm \infty}, u_{0 \pm \infty}), \pm x > 0. \quad (1.6) $$

The existence of an entropy solution of (1.1), (1.2), (1.3), (1.4), (1.5), (1.6), is given for instance by the splitting scheme used in [23]. When $\varepsilon \to 0$, we are going to prove that the density converges to the solution $r$ of the following heat equation, where $s = \varepsilon t$ is a "slow" time.

$$ \frac{\partial r}{\partial s} - \frac{\partial^2 r}{\partial x^2} = 0, \quad r(0, x) = \rho_0(x). \quad (1.7) $$

Our main result is:

**Theorem 1.1**

Assume that (1.5) and (1.6) are satisfied. For any $\varepsilon \in (0, 1]$, let $(\rho^\varepsilon, u^\varepsilon)$ be an entropy solution to (1.1), (1.2), (1.3), (1.4), constructed by the splitting scheme used in [23]. Then:

(i) There exists $C$, such that for all $T > 0$:

$$ \int_0^T \int_{\mathbb{R}} |\rho^\varepsilon(t, x) - r(\varepsilon t, x)|^2 dx dt \leq C \varepsilon \left(1 + \sqrt{\varepsilon T}\right). \quad (1.8) $$

(ii) Furthermore, if $\rho_{-\infty} = \rho_{+\infty}$, we have:

$$ \int_0^{+\infty} \int_{\mathbb{R}} |\rho^\varepsilon(t, x) - r(\varepsilon t, x)|^2 dx dt \leq C \varepsilon. \quad (1.9) $$

These estimates can be used to study two limits, first, when $\varepsilon \to 0$, and next when $t \to +\infty$ and $\varepsilon > 0$ is fixed. The first limit is clearly described in formulas (1.7) to (1.9). In order to describe the second limit, let us first recall that the solution of the heat equation converges for large time to the unique self-similar solution with the same limits at $\pm \infty$:

$$ \frac{\partial \bar{r}}{\partial t} - \frac{\partial^2 \bar{r}}{\partial x^2} = 0, \quad \bar{r}(t, x) = \bar{r}(z) \text{ where } z = \frac{x}{\sqrt{t}} \text{ and } \bar{r}(\pm \infty) = \rho_{\pm \infty}, \quad (1.10) $$

see [8, 9]. Trivially, if $\rho_{+\infty} = \rho_{-\infty}$, $\bar{r}$ is a constant : $\bar{r} \equiv \rho_{\infty}$. In this case, we give a few results of convergence, see also [Nishida??]. In general, $\bar{r}$ has the following classical expression : $\bar{r}(z) = \rho_{-\infty} + (\rho_{+\infty} - \rho_{-\infty})/(4\pi)^{1/2} \int_{-\infty}^z \exp(-w^2/4) dw$.

Combining this with Theorem 1.1, we give in Corollary 1.1 straightforward consequences of Theorem 1.1. Then, using a Hardy type of Lemma as in [9], we obtain better results of convergence in Theorem 1.2.

Since $\varepsilon$ is fixed, we fix $\varepsilon = 1$ and we drop the superscript $\varepsilon$.

**Corollary 1.1**

Under the same assumption as in Theorem 1.1, there exists $C > 0$, such that any entropy solution constructed by this scheme satisfies:

$$ \frac{1}{T} \int_0^T \int_{\mathbb{R}} |\rho(t, x) - \bar{\rho}(x/\sqrt{t})|^2 dx dt \leq \frac{C}{\sqrt{T}}. \quad (1.11) $$

Furthermore, if $\rho_{-\infty} = \rho_{+\infty} = \rho_{\infty}$, we have:

$$ \lim_{t \to +\infty} \int_{\mathbb{R}} |\rho(t, x) - \rho_{\infty}|^2 dx = 0. \quad (1.12) $$
In general, there is no better rate of convergence of a solution to the heat equation to the self-similar solution.

Combining now Theorem 1.1 and Corollary 1.1 with results of [9], and using the same variables, we improve the above rate of convergence of the density towards the self-similar solution \( \mathfrak{r} \).

**Theorem 1.2**

*Under the same assumption as in Theorem 1.1, for any fixed \( L \in [0, \infty] \), there exists \( C_L > 0 \), such that for any entropy solution constructed by the same scheme satisfies:*

\[
\int_{\mathbb{R}} |\rho(t, z \sqrt{t}) - \mathfrak{r}(z)|^2 \, dz \leq \frac{C_{\infty}}{t^{1/4}},
\]

\[
\int_{|z| \leq L} |\rho(t, z \sqrt{t}) - \mathfrak{r}(z)|^2 \, dz \leq \frac{C_L}{\sqrt{t}}.
\]

*Furthermore, if \( \rho_{-\infty} = \rho_{+\infty} = \rho_{\infty} \), we have:*

\[
\int_{\mathbb{R}} |\rho(t, z \sqrt{t}) - \rho_{\infty}|^2 \, dz \leq \frac{C_{\infty}}{\sqrt{t}},
\]

\[
\int_{|z| \leq L} |\rho(t, z \sqrt{t}) - \rho_{\infty}|^2 \, dz \leq \frac{C_L}{t^{3/4}}.
\]

Let us now comment these results. In Theorem 1.1, we consider the limit when \( \varepsilon \to 0 \) of large weak entropy solutions to (1.1), (1.2), (1.3), (1.4), and we prove the convergence towards the solution of the heat equation with the same initial datum \( \overline{p}_0 \). The convergence is established in the space \( L^2_{t,x} \), globally in space, and globally in time if the limits \( \rho_{\pm \infty} \) of the density when \( x \to \pm \infty \) are the same.

When \( \rho_{+\infty} \neq \rho_{-\infty} \), the \( L^2 \) convergence is established in any strip \( \{ (t, x) ; 0 \leq t \leq \frac{T}{\varepsilon^{1+\delta}}, x \in \mathbb{R} \} \), for any \( T > 0 \) and \( \delta > 0 \). We note that e.g. results obtained by the compensated compactness [17, 18, 21] are in general local.

We also refer to [14], who studied the zero relaxation limit of a slightly more general system. The show the convergence, in the original variables \( (t, x) \), to the solution to \( \partial_t \rho = 0, \rho(0, x) = \rho_0(x) \). Our result can be viewed as a refinement of the above result, and \( r - \rho_0 \) as a corrector term.

In Corollary 1.1 and Theorem 1.1 we have combined the above results with the classical decay estimates for the heat equation, to study the limit \( t \to +\infty, \varepsilon > 0 \) fixed.

In the case of a general \( p \)-system, and for small smooth solutions, H. Ling and T.P. Liu have studied in [8], the limit \( t \to +\infty, \varepsilon > 0 \) fixed, and obtained precise rates of convergence when \( t \to +\infty \) towards the self-similar solution to the corresponding porous media equation, using an appropriate shift of coordinates, for which some moment of the initial data vanishes.

On the other hand, the same limit \( t \to +\infty, \varepsilon > 0 \) fixed, has been studied in [9] for a \( p \)-system with a change of convexity, where the Authors show, for any \( L > 0 \), the \( L^2 \) convergence of large weak entropy solutions at time \( t \), in a parabolic domain \( \{ x ; x^2 \leq L \} \), but do not give any rate of convergence.

Let us emphasize that our results of convergence are not restricted to large times, but are already valid for small times, including in the initial layer. In this spirit observe that (1.9) would be optimal if the difference \( (\rho^\varepsilon(t, \cdot) - r(\varepsilon t, \cdot)) \) behaved like \( \exp(-t/\varepsilon) \) when \( \varepsilon \to 0_+ \).

The outline of the proof of Theorem 1.1 is as follows. First, using the same scaling as in [19], see also [10, 17, 18], we introduce a slow time \( s := \varepsilon t \), and define

\[
\hat{\rho}^\varepsilon(s, x) = \rho^\varepsilon \left( \frac{s}{\varepsilon}, x \right); \quad \hat{u}^\varepsilon(s, x) = \frac{1}{\varepsilon} u^\varepsilon \left( \frac{s}{\varepsilon}, x \right),
\]

(1.17)
\( \frac{\partial \varrho^\varepsilon}{\partial s} + \frac{\partial}{\partial x} (\varrho^\varepsilon v^\varepsilon) = 0, \) 
\( \varepsilon^2 \frac{\partial}{\partial s} (\varrho^\varepsilon v^\varepsilon) + \varepsilon^2 \frac{\partial}{\partial x} (\varrho^\varepsilon (v^\varepsilon)^2) + \frac{\partial}{\partial x} \varrho^\varepsilon = -\varrho^\varepsilon v^\varepsilon, \)  
with the initial data

\[ \varrho^\varepsilon (0, x) = \rho_0(x), \quad v^\varepsilon (0, x) = \frac{u_0(x)}{\varepsilon}. \]

Assuming that we can pass to the limit in (1.19), and combining with (1.18), we formally obtain (1.7).

Our method of proof uses a stream function which plays the role of the Lagrangian mass coordinate, and a suitable integration by parts which provides global estimates, contrary to the div-curl lemma, which only implies local strong convergences. Also, we estimate the \( L^2 \) norm in space and time of the difference between the density and its limit.

The outline of this paper is as follows. In section 2, we sketch the proof of Theorem 1.1 in the simpler case of compactly supported initial data, with a general pressure law, where there is no technical difficulty. In section 3, we give a \( BV \) estimate, uniform both in time and in \( \varepsilon \), and we obtain a positive lower bound for \( \varrho^\varepsilon \). In section 4, we give an entropy inequality and deduce various a priori estimates. In section 5, we introduce the Lagrangian mass coordinate \( \psi \). In section 6, we use a modification of the div-curl lemma to conclude the proof of Theorem 1.1. In section 7, we study the large time behavior. Finally, in section 8 and 9, we have collected the (tedious) proofs of some technical results.

## 2 The case of compactly supported initial data, with a general pressure law

In this Section, we give the main ideas to prove Theorem 1.1 in the simple case of compactly supported initial data. The key-tool is the stream-function \( \psi \) associated to the equation of mass conservation. Indeed, we multiply the momentum equation by \( \psi \), and after some calculations, we are going to justify (1.9) in this simple case.

More precisely, let \( \rho_\infty, u_\infty \in \mathbb{R} \), assume that the pressure law \( p(\rho) \) satifies \( p \in C^0([0, +\infty)) \cap C^2((0, +\infty)) \), and assume that:

There exists a globally defined solution \( (\varrho^\varepsilon, v^\varepsilon) \), uniformly bounded in \( L^\infty \), in \( \varepsilon \), such that:
\( \forall T > 0, (\varrho^\varepsilon(t, x) - \rho_\infty) \) and \( (\varrho^\varepsilon(t, x)u^\varepsilon(t, x) - \rho_\infty u_\infty) \) are compactly supported, on \( (0, T) \times \mathbb{R} \)

\[ \rho_{\text{min}} := \inf_{x \in \mathbb{R}} \rho_0(x) > 0 \]
\[ p' > 0 \quad \text{and} \quad p'' \geq 0 \quad \text{on} \quad [0, +\infty[ \]

For example, these assumptions are satisfied for \( p(\rho) = \rho^\gamma, \gamma > 1 \), see [21], see [15] for the case without source term. For \( \gamma = 1 \) see [22, 23] and see Section 3.

**Theorem 2.1**

Assume that (2.1), (2.2), (2.3) are satisfied. Let \( r \) be the solution to
\[ \frac{\partial r}{\partial s} - \frac{\partial^2 p(r)}{\partial x^2} = 0, \quad r(0, x) = \rho_0(x). \]
Then the sequence \( (\rho^\varepsilon(t,x) - r(\varepsilon t,x)) \) converges strongly in \( L^2(\mathbb{R}^+ \times \mathbb{R}) \) to 0. More precisely, there exist a constant \( C \), independent of \( \varepsilon \), such that:

\[
\int_0^{+\infty} \int_{\mathbb{R}} |\rho^\varepsilon(t,x) - r(\varepsilon t,x)|^2 \, dx \, dt \leq C\varepsilon.
\]  

(2.5)

**Remark 2.1:** In any case, even if the initial data do not avoid the vacuum, we obtain:

\[
\int_0^{+\infty} \int_{\mathbb{R}} [p(\rho^\varepsilon(t,x)) - p(r(\varepsilon t,x))] [\rho^\varepsilon(t,x) - r(\varepsilon t,x)] \, dx \, dt \leq C\varepsilon.
\]  

(2.6)

**Proof:** Setting \( g^\varepsilon(s,x) := \rho^\varepsilon(s/\varepsilon,x) \), \( v^\varepsilon(s,x) := u^\varepsilon(s/\varepsilon,x) / \varepsilon \), \( p := p(r) \), \( \pi^\varepsilon := p(g^\varepsilon) \), the system rewrites:

\[
\begin{align*}
\partial_s (g^\varepsilon - r) + \partial_x (g^\varepsilon v^\varepsilon + \partial_x p) &= 0, \\
\varepsilon^2 \partial_s (g^\varepsilon v^\varepsilon) + \varepsilon^2 \partial_x (g^\varepsilon (v^\varepsilon)^2) + \partial_x (\pi^\varepsilon - p) &= -(g^\varepsilon v^\varepsilon + p).
\end{align*}
\]  

(2.7)  

(2.8)

Define the stream function \( z^\varepsilon \) from the first equation by:

\[
\partial_x z^\varepsilon := g^\varepsilon - r, \quad \partial_s z^\varepsilon := -(g^\varepsilon v^\varepsilon + \partial_x p), \quad z^\varepsilon(0,x) := 0.
\]

Then multiply (2.8) by \( z^\varepsilon \) and integrate by parts over the strip \([0,S] \times \mathbb{R}\), to obtain:

\[
\varepsilon^2 \int_0^S \int_{\mathbb{R}} g^\varepsilon v^\varepsilon (\partial_x p) \, dx \, ds + \varepsilon^2 \int_0^S \int_{\mathbb{R}} g^\varepsilon (v^\varepsilon)^2 (\pi^\varepsilon - p) \, dx \, ds
\]

\[
= A + B + C = \int_0^S \int_{\mathbb{R}} (\partial_s (\pi^\varepsilon - p)(\pi^\varepsilon - r)) \, dx \, ds + 1/2 \int_{\mathbb{R}} (z^\varepsilon)^2(S,x) \, dx := C + D.
\]  

(2.9)  

(2.10)

Now, the classical entropy inequality :

\[
\partial_t (\rho^\varepsilon (u^\varepsilon)^2 / 2 + P(c^\varepsilon)) + \partial_x \left[ \rho^\varepsilon (u^\varepsilon)^3 / 2 + P'(\rho^\varepsilon) \rho^\varepsilon u^\varepsilon \right] + \rho^\varepsilon (u^\varepsilon)^2 / \varepsilon \leq 0,
\]

where \( P \geq 0 \) and \( P''(\rho) := p'(\rho) / \rho \), can be rewritten in \((s,x)\) variables:

\[
\partial_s (\varepsilon^2 \rho^\varepsilon (\tilde{u}^\varepsilon)^2 / 2 + P(\rho^\varepsilon)) + \partial_x \left[ \rho^\varepsilon (\tilde{u}^\varepsilon)^3 / 2 + P'(\rho^\varepsilon) \rho^\varepsilon \tilde{u}^\varepsilon \right] + \rho^\varepsilon (\tilde{u}^\varepsilon)^2 \leq 0.
\]

(2.11)

Now, (2.11) implies

\[
\varepsilon^2 \int_{\mathbb{R}} \rho^\varepsilon (v^\varepsilon)^2(S,x) \, dx + \int_{\mathbb{R}} (\rho^\varepsilon v^\varepsilon)^2 \, dx = O(1).
\]  

(2.12)

Now we can study the terms of (2.9),(2.10):

\[
A := \varepsilon^2 \int_0^S \int_{\mathbb{R}} g^\varepsilon v^\varepsilon (\partial_x p) \, dx \, ds = A_1 + A_2 = \varepsilon^2 \int_0^S \int_{\mathbb{R}} g^\varepsilon [g^\varepsilon (v^\varepsilon)^2] \, dx \, ds + \varepsilon^2 \int_0^S \int_{\mathbb{R}} \rho^\varepsilon v^\varepsilon \partial_x p \, dx \, ds
\]

\[
= O(\varepsilon^2).
\]

Then, \( A_1 \) is bounded by (2.1) and (2.12). On the other hand, since \( r \) is the solution to (2.4), \( \partial_x p(r) \) is classically bounded in \( L^2 \). Therefore, by Cauchy-Schwarz inequality, we obtain \( A_2 = O(\varepsilon^2) \).

Now, by (2.12) and Young inequality, we have:

\[
B := \varepsilon^2 \int_{\mathbb{R}} g^\varepsilon (v^\varepsilon z^\varepsilon(S,x) \, dx \leq 2\varepsilon^2 \int_{\mathbb{R}} (g^\varepsilon v^\varepsilon)^2(S,x) \, dx + \varepsilon^2 / 8 \int_{\mathbb{R}} (z^\varepsilon)^2(S,x) \, dx
\]

\[
\leq O(1) + \varepsilon^2 / 8 \int_{\mathbb{R}} (z^\varepsilon)^2(S,x) \, dx.
\]

5
Finally, $C := \varepsilon^2 \int_0^S \int_{\mathbb{R}} \varrho^\varepsilon (v^\varepsilon)^2 (\varrho^\varepsilon - r) dx ds = O(\varepsilon^2)$ by (2.1) and by (2.12).

Combining these estimates for $0 < \varepsilon \leq 1$:

$$
\int_0^S \int_{\mathbb{R}} \left( \pi^\varepsilon - p \right) (\varrho^\varepsilon - r) dx ds + 1/4 \int_{\mathbb{R}} (v^\varepsilon)^2(S, x) dx = O(\varepsilon^2).
$$

(2.13)

Since $r$ (but perhaps not $\varrho^\varepsilon$) avoids the vacuum and since the pressure satisfies (2.3),

$$(p(x) - p(y))(x - y) \geq \alpha(x - y)^2, \quad \forall x \geq \rho_{\min}, \text{ and } y \geq 0,$$

with $\alpha := (p(\rho_{\min}) - p(0))/\rho_{\min} > 0$, which concludes the proof. \hfill \Box

3 A uniform BV estimate

For any fixed $\varepsilon > 0$, it is proven in [23] that a more general system - the Isothermal Euler-Poisson system - admits a globally defined weak entropy solution

$$(\rho^\varepsilon, u^\varepsilon) \in C^0((0, +\infty), L^1_{\text{loc}}(\mathbb{R})) \cap L^\infty_{\text{loc}}((0, +\infty), BV(\mathbb{R})).$$

We recall that $BV$ is the space of functions of $x$ with bounded variation, i.e. whose derivatives live in the space $M_1(\mathbb{R})$ of bounded measures on $\mathbb{R}$.

For the Isothermal Euler-Poisson system, see [10], it is not clear whether this $BV$ estimate is uniform with respect to $\varepsilon$, and even with respect to time when $t \to +\infty$. Here, in this simpler case, this is indeed the case.

**Proposition 3.1 (L$^\infty$ and BV bounds)**

There exists $0 < \varrho_{\min}^\varepsilon \leq \varrho_{\max}^\varepsilon$, and $K$ such that $\forall \varepsilon > 0, \forall (s, x) \in (0, +\infty) \times \mathbb{R}$:

$$0 < \varrho_{\min}^\varepsilon \leq \varrho^\varepsilon(s, x) \leq \varrho_{\max}^\varepsilon, \quad TV \varrho^\varepsilon(s, \cdot) \leq K,$$

$$|v^\varepsilon(s, x)| \leq \frac{K}{\varepsilon}, \quad TV v^\varepsilon(s, \cdot) \leq \frac{K}{\varepsilon}.$$

(3.1)

(3.2)

The proof of Proposition 3.1. It uses classical ideas, (see [13, 22, 23], ... and more recently [14])).

For convenience, we do not give the classical proof.

4 An entropy inequality

As in Section 2, it is easy to establish all the estimates in this Section where $u_0$ is compactly supported and if $\rho_0$ has the same limits as $x \to \pm \infty$. In the general case, see also [8], [9], ... the proof is (unfortunately!) much longer, and the estimates are no longer uniform in time. For clarity, we divide the proof in several steps.

In this section we establish the entropy inequality in order to control the kinetic energy. Observe that the initial data are not in $L^1$, since they do not vanish at infinity. Therefore, we substract simple functions which have the same limits as the solution at $\pm \infty$.

Let $m(x)$ a nonnegative smooth function with "unit mass", see [8]. Let $H(x) := \int_{-\infty}^x m(y) dy$. Therefore $H$ is a regularization of the Heaviside function. We introduce $\forall (s, x) \in (0, +\infty) \times \mathbb{R}$:

$$V(s, x) := \frac{1}{\varepsilon} \exp \left( -\frac{s}{\varepsilon^2} \right) \left( u_{0, -\infty} + (u_{0, +\infty} - u_{0, -\infty}) H(x) \right),$$

(4.1)
and we note that

\[ V(s, \pm \infty) = v^\varepsilon(s, \pm \infty), \quad \frac{\partial V}{\partial s} = -\frac{1}{\varepsilon^2} V. \]  

(4.2)

The aim of this section is to deduce the following estimates from the entropy inequality.

**Proposition 4.1 (Bounds on the kinetic energy)**

There exists a constant $C$, independent of $\varepsilon$, such that for all $S > 0$

\[ \varepsilon^2 \int_\mathbb{R} \rho^\varepsilon (v^\varepsilon - V)^2(S, x) dx \leq C \left( 1 + \Delta \theta \sqrt{S} \right), \]  

(4.3)

\[ \int_0^S \int_\mathbb{R} \rho^\varepsilon (v^\varepsilon - V)^2(s, x) dx ds \leq C \left( 1 + \Delta \theta \sqrt{S} \right), \]  

(4.4)

\[ \Delta \rho := |\rho_{+\infty} - \rho_{-\infty}|. \]  

(4.5)

**Step 1**: First, we need to recall a few bounds for the solution to the heat equation. The behavior is different if $\rho_{-\infty} = \rho_{+\infty}$ or $\rho_{-\infty} \neq \rho_{+\infty}$. The following bounds are optimal when $\Delta \rho \neq 0$.

**Lemma 4.1 (Bounds for the heat equation)**

$r$ is solution of (1.7) with BV initial data. We have the following bounds for all $(s, S, x) \in (0, +\infty)^2 \times \mathbb{R}$, where $\Delta \rho$ is defined by (4.5)

\[ 0 < \rho^*_{\min} \leq r(s, x) \leq \rho^*_{\max}, \]  

(4.6)

\[ \int_\mathbb{R} \left| \frac{\partial r}{\partial x} \right|(s, x) dx = O(1), \quad \int_0^S \int_\mathbb{R} \left( \frac{\partial r}{\partial x} \right)^2(s, x) dx = O \left( 1 + \Delta \theta \sqrt{S} \right), \]  

(4.7)

\[ \int_\mathbb{R} \left| \frac{\partial^2 r}{\partial x^2} \right|(s, x) dx = O \left( \frac{1}{\sqrt{s}} \right), \quad \int_0^S \int_\mathbb{R} \left| \frac{\partial^2 r}{\partial x^2} \right|^2(s, x) dx ds = O \left( \sqrt{S} \right). \]  

(4.8)

**Proof**: The results (4.6) are obvious. In order to prove first inequality (4.7), for instance, we differentiate (1.7) with respect to $x$, next we multiply by the sign of $\partial_x r$, integrate over $\mathbb{R}$, and integrate by parts the second term: $\partial_s \int_\mathbb{R} |\partial_x r|(s, x) dx + \int_\mathbb{R} \text{sign}(\partial_x r)(\partial_x^2 r)^2(s, x) dx = 0$. Therefore, $\partial_s \int_\mathbb{R} |\partial_x r|(s, x) dx \leq 0$, which gives us the first inequality (4.7).

If $\Delta \rho = 0$, second inequality (4.7) is the classical energy estimate for heat equation. If $\Delta \rho > 0$, we write $r(s, x) = (E(s, .) * \rho_0(.))(x)$ with $E(s, x) = \frac{1}{\sqrt{4\pi S}} \exp \left( -\frac{x^2}{4S} \right)$. Since $\int_\mathbb{R} E^2(s, x) dx = O \left( \frac{1}{\sqrt{S}} \right)$ and $\partial_x r = E * \partial_x \rho_0$, we can estimate $\| \partial_x r(s, .) \|_{L^2(\mathbb{R})}^2$. Integrating in $s$, over $(0, S)$ we obtain the second inequality (4.7).

We prove (4.8) in a similar way. For instance, we see that inequalities are optimal, if $\Delta \rho \neq 0$, by computing the exact solution with a Heaviside initial data. \hfill \square

**Step 2**: *Entropy inequality*. We need to subtract suitable functions, in order to deal with integrable functions. In $(s, x)$ variables, we have

\[ \frac{\partial}{\partial s} \left( \varepsilon^2 \frac{(v^\varepsilon)^2}{2} + \varphi \ln(\varphi^\varepsilon) \right) + \frac{\partial}{\partial x} \left( \varepsilon^2 \theta^\varepsilon \frac{(v^\varepsilon)^3}{2} + \theta^\varepsilon \varphi \ln(\varphi^\varepsilon) + \theta^\varepsilon v^\varepsilon \right) + \varphi^\varepsilon (v^\varepsilon)^2 \leq 0 \]  

(4.9)

Let us define

\[ \varphi(\rho) := \varphi(t, x, \rho) = \psi(\rho) - (\psi(r) + \psi'(r)(\rho - r)) = \rho \ln \left( \frac{\rho}{r} \right) - (\rho - r), \]  

(4.10)
where $\psi(\rho) := \rho \ln(\rho)$. By convexity $\varphi \geq 0$, and $\varphi(\varrho^\varepsilon)(s, \pm \infty) = 0$.

Using (1.18), we obtain
\[
\frac{\partial}{\partial s} \left( \varrho^\varepsilon \ln(\varrho^\varepsilon) \right) = \partial_s (\varphi(\varrho^\varepsilon)) - \partial_x ((1 + \ln r) \varrho^\varepsilon v^\varepsilon) + \varrho^\varepsilon v^\varepsilon \partial_x \ln r + \varrho^\varepsilon \partial_s \ln r - \partial_s r
\]

Similarly, using (1.18), (1.19) and (4.2), we obtain (after some tedious calculations ...)
\[
\varepsilon^2 \partial_s \left( \varrho^\varepsilon \frac{(v^\varepsilon)^2}{2} \right) = \varepsilon^2 \partial_s \left( \varrho^\varepsilon \frac{(v^\varepsilon - V)^2}{2} \right) + \partial_x \left( \varrho^\varepsilon V \left( \varepsilon^2 v^\varepsilon \left( \frac{V}{2} - v^\varepsilon \right) - 1 \right) \right) + \varrho^\varepsilon (v^\varepsilon)^2 \partial_x V + \varrho^\varepsilon v^\varepsilon \left( -V(2 + \varepsilon^2 \partial_x V) + \varrho^\varepsilon (V^2 + \partial_x V) \right)
\]

Adding up the previous results we obtain the entropy inequality:

**Lemma 4.2 (Entropy inequality)**
\[
\varepsilon^2 \frac{\partial}{\partial s} \left( \varrho^\varepsilon \frac{(v^\varepsilon - V)^2}{2} \right) + \frac{\partial}{\partial s} (\varphi(\varrho^\varepsilon)) + \frac{\partial}{\partial x} Q_2 + R_2 \leq 0
\]
\[
Q_2 = \varepsilon^2 \varrho^\varepsilon \frac{(v^\varepsilon)^3}{2} + \varrho^\varepsilon v^\varepsilon \ln \left( \frac{\varrho^\varepsilon}{r} \right) + \varrho^\varepsilon V \left( \varepsilon^2 v^\varepsilon \left( \frac{V}{2} - v^\varepsilon \right) - 1 \right)
\]
\[
R_2 = \varrho^\varepsilon (v^\varepsilon)^2 (1 + \varepsilon^2 \partial_x V) + \varrho^\varepsilon v^\varepsilon \left( \partial_x \ln r - V(2 + \varepsilon^2 \partial_x V) \right) + \varrho^\varepsilon \left( \partial_s \ln r + V^2 + \partial_x V \right) - \partial_s r
\]

**Step 3:** In the next Lemma, we estimate $\partial_s Q_2$ and $R_2$.

**Lemma 4.3**
\[
\int_0^s \int_{\mathbb{R}} \frac{\partial Q_2}{\partial x} dxd{s} = O(\varepsilon); \quad R_2 = \varrho^\varepsilon (v^\varepsilon - V)^2 + R_3;
\]
\[
\int_0^s \int_{\mathbb{R}} |R_3| dxd{s} \leq \frac{1}{2} \int_0^s \int_{\mathbb{R}} (\varrho^\varepsilon (v^\varepsilon - V)^2) dxd{s} + O \left( 1 + \Delta \rho \sqrt{S} \right).
\]

**Proof:** For the first estimate, we obtain easily
\[
\int_0^{+\infty} (Q_2(s, +\infty) - Q_2(s, -\infty)) ds = \varepsilon (\rho_{-\infty}, u_{0,-\infty} - \rho_{+\infty}, u_{0, +\infty})
\]

Now, we estimate $R_2$. Replacing again $\varrho^\varepsilon (v^\varepsilon)^2$ by $\varrho^\varepsilon (v^\varepsilon - V)^2 + 2 \varrho^\varepsilon v^\varepsilon V - \varrho^\varepsilon V^2$ we obtain:
\[
R_3 = \varrho^\varepsilon (v^\varepsilon - V)^2 \varepsilon^2 \partial_x V + \varrho^\varepsilon v^\varepsilon (\partial_x \ln r + \varepsilon^2 V \partial_x V) + \varrho^\varepsilon \partial_x \ln r + (1 - \varepsilon^2 V^2) \partial_x V - \partial_x r
\]
\[
= \left[ \partial_x V \left( \varrho^\varepsilon (v^\varepsilon - V)^2 \varepsilon^2 + \varrho^\varepsilon v^\varepsilon V + 1 - \varepsilon^2 V^2 \right) \right] + \left[ \varrho^\varepsilon v^\varepsilon \partial_x \ln r \right] + \left[ \varrho^\varepsilon \partial_x \ln r - \partial_x r \right]
\]
\[
:= R_3^1 + R_3^2 + R_3^3.
\]

Since $\varrho^\varepsilon, \varepsilon v^\varepsilon, \varepsilon V$ are bounded in $L^\infty$ and $\partial_x V$ is bounded in $L^1$, $R_3^1$ is bounded in $L^1$, uniformly in $\varepsilon$ and in $s$.

Now, since $\partial_x r = \partial_x^2 r$ we obtain $\|R_3^3\|_{L^1((0, T) \times \mathbb{R})} = O \left( \sqrt{S} \right)$.

Finally we can estimate $|R_3^3|$:
\[
|\varrho^\varepsilon v^\varepsilon \partial_x \ln r| \leq |\sqrt{\varrho^\varepsilon (v^\varepsilon - V)} \sqrt{\varrho^\varepsilon \partial_x \ln r}| + |\varrho^\varepsilon v^\varepsilon \partial_x \ln r|
\]
\[
\leq \frac{1}{2} \varrho^\varepsilon (v^\varepsilon - V)^2 + \frac{\varrho^\varepsilon}{(r)^2} (\partial_x r)^2 + \frac{\varrho^\varepsilon}{r} |V| |\partial_x r| := a + b + c.
\]

8
By (4.6) and (4.7), \( \| b \|_{L^1(0,S) \times \mathbb{R}} = O \left( 1 + \Delta \varrho \sqrt{S} \right) \). Similarly, due to (4.7), and to the exponential decay of \( V \) in time, \( \| c \|_{L^1(0,\infty) \times \mathbb{R}} = O (\varepsilon) \).

Finally, summing up these estimates, we obtain
\[
\int_0^S \int_{\mathbb{R}} |R_s| dx ds \leq \frac{1}{2} \int_0^S \int_{\mathbb{R}} \varrho^2 (v^\varepsilon - V)^2 dx ds + O \left( 1 + \sqrt{S} \right),
\]
which concludes the proof if \( \Delta \varrho \neq 0 \), i.e. if \( \rho_{-\infty} \neq \rho_{+\infty} \). Note that \( O \left( \sqrt{S} \right) \) comes from the estimate on the derivative of \( r \). So, if \( \Delta \varrho = 0 \) we can replace \( r \) by the constant \( \rho_{+\infty} \), so that the above estimates are now uniform in \( S \). \( \square \)

We now are able to prove Proposition 4.1:

**Step 4**: Proof of Proposition 4.1: Integrating the entropy inequality (4.9) over \((0,S) \times (-L,+L)\), using the previous Lemma and passing to the limit when \( L \) goes to infinity, we obtain for all \( S > 0 \):
\[
\varepsilon^2 \int_{\mathbb{R}} \varrho^2 (v^\varepsilon - V)^2 (S,x) dx + \int_{\mathbb{R}} \varphi(v^\varepsilon)(s,x) dx + \int_0^S \int_{\mathbb{R}} \varrho^2 (v^\varepsilon - V)^2 (s,x) dx ds = O \left( 1 + \Delta \varrho \sqrt{S} \right),
\]
which implies (4.3) and (4.4), since \( \varphi \) is nonnegative.

## 5 Euler system rewritten

Again, since the involved functions are not integrable on \( \mathbb{R} \), we need to establish a few technical lemmas in this Section, before proving Theorem 1.1 in Section 6. These (tedious) calculations can be skipped at the first reading. We first rewrite Euler system (1.18), (1.19) in terms of \((\varrho^\varepsilon - r)\), and then we establish some useful bounds.

**Lemma 5.1 (Euler system rewritten)**
In \((s,x) = (\varepsilon t, x)\), functions \( \varrho^\varepsilon \) and \( v^\varepsilon(s,x) := u^\varepsilon(t,x)/\varepsilon \) are solutions of
\[
\begin{align*}
\frac{\partial}{\partial s} (\varrho^\varepsilon - r) + \frac{\partial}{\partial x} \left( \varrho^\varepsilon v^\varepsilon + \frac{\partial r}{\partial x} \right) &= 0, \quad (5.1) \\
\varepsilon^2 \frac{\partial}{\partial s} (\varrho^\varepsilon (v^\varepsilon - V)) + \frac{\partial}{\partial x} \left( \varrho^\varepsilon (v^\varepsilon - V)^2 + \varphi(v^\varepsilon - V) \right) &= - \left( \varrho^\varepsilon (v^\varepsilon - V) + \frac{\partial r}{\partial x} \right). \quad (5.2)
\end{align*}
\]
**Proof**: The first equation is obvious. As to (5.2), observe that
\[
\begin{align*}
\varepsilon^2 \partial_s (\varrho^\varepsilon v^\varepsilon) &= \varepsilon^2 \partial_s (\varrho^\varepsilon (v^\varepsilon - V)) + \varepsilon^2 \partial_s (\varrho^\varepsilon V) \\
\varepsilon^2 \partial_s (\varrho^\varepsilon V) &= \varepsilon^2 \partial_s (\varrho^\varepsilon V) + \varepsilon^2 \partial_s (\varrho^\varepsilon V) \\
&= - \varepsilon^2 \partial_s (\varrho^\varepsilon v^\varepsilon) - \varepsilon^2 \partial_s (\varrho^\varepsilon V) \\
\varepsilon^2 \partial_x (\varrho^\varepsilon (v^\varepsilon)^2) &= \varepsilon^2 \partial_x (\varrho^\varepsilon (v^\varepsilon - V)^2) + \varepsilon^2 \partial_x (\varrho^\varepsilon 2v^\varepsilon V) - \varepsilon^2 \partial_x (\varrho^\varepsilon V^2)
\end{align*}
\]
Adding these three equations, we obtain equation (5.2). \( \square \)

We deduce from (5.1) and (5.2) the following crude bounds:
Lemma 5.2 (Bounds on \((q^\varepsilon - r)\))

\[ \forall s \in (0, +\infty) : \int_{\mathbb{R}} |q^\varepsilon - r|(s, x) \, dx = O\left(\frac{s}{\varepsilon} + \frac{s^2}{\varepsilon^2}\right), \quad \int_{\mathbb{R}} |q^\varepsilon - r|^2(s, x) \, dx = O\left(\frac{s}{\varepsilon} + \frac{s^2}{\varepsilon^2}\right). \]

**Proof**: Multiplying \((5.1)\) by a regularisation of the sign of \((q^\varepsilon - r)\), using the chain rule formula for \(BV\) functions and passing to the limit, we obtain the following inequality in the sense of measures

\[ \partial_s |q^\varepsilon - r| \leq |\partial_x(q^\varepsilon v^\varepsilon)| + |\partial_x^2 r| \]

Using \((4.8)\) and the bounds of Proposition 3.1, we obtain:

\[ \partial_s |q^\varepsilon - r|(s, \cdot)(\mathbb{R}) \leq O\left(\frac{1}{\varepsilon}\right) + \int_{\mathbb{R}} |\partial_x^2 r|(s, x) \, dx \]

Integrating over \((0, S)\) we obtain the first result of the Lemma, and \((q^\varepsilon - r)\) is bounded in \(L^\infty\), which concludes the proof. \(\Box\)

Lemma 5.3 (Crude bounds) \(\forall s, S \in (0, +\infty)\):

\[ \int_{\mathbb{R}} v^\varepsilon - V|(s, x) \, dx = O\left(1 + \frac{1}{\varepsilon} \exp\left(-\frac{s}{\varepsilon^2}\right)\right), \quad \int_{0}^{S} \int_{\mathbb{R}} v^\varepsilon - V|(s, x) \, dxds = O(S + \varepsilon), \quad (5.3) \]

\[ \int_{\mathbb{R}} |q^\varepsilon v^\varepsilon - \rho_0 V|(s, x) \, dx = O\left(1 + \frac{1}{\varepsilon} \exp\left(-\frac{s}{\varepsilon^2}\right)\right), \quad \int_{0}^{S} \int_{\mathbb{R}} |q^\varepsilon v^\varepsilon - \rho_0 V|(s, x) \, dxds = O(S + \varepsilon). (5.4) \]

**Proof**: Multiplying \((5.2)\) again by a regularization of the sign of \(q^\varepsilon(v^\varepsilon - V)\) and proceeding as in Lemma 5.2, we obtain, from Proposition 3.1, in the sense of \(L^\infty((0, +\infty), M^1(\mathbb{R}))\):

\[ \varepsilon^2 \frac{dY}{ds} + Y = O(1) \quad \text{where } Y(s) = \int_{\mathbb{R}} |q^\varepsilon(v^\varepsilon - V)|(s, x) \, dx. \]

Now, since \(Y(0) = O \left(\frac{1}{\varepsilon}\right)\), we obtain by Gronwall’s Lemma:

\[ Y(s) = O \left(1 + \frac{1}{\varepsilon} \exp\left(-\frac{s}{\varepsilon^2}\right)\right), \quad \text{which implies (5.3) after integration}. \]

Using now the momentum equation \((1.19)\), we see that:

\[ \varepsilon^2 \partial_s(q^\varepsilon v^\varepsilon - \rho_0 V) + (q^\varepsilon v^\varepsilon - \rho_0 V) = -\varepsilon^2 \partial_x(q^\varepsilon (v^\varepsilon)^2) - \partial_x q^\varepsilon. \]

Using again Proposition 3.1 and the above arguments, we obtain \((5.4)\). \(\Box\)

6 Proof of Theorem 1.1

In this section, we establish Theorem 1.1 and its Corollary 1.1. The idea is to introduce the "stream function" \(\psi^\varepsilon\), defined in equation \((6.1)\) below, which plays the role of the Lagrangian mass coordinate, see [2], and then to multiply \((5.2)\) by \(\psi^\varepsilon\) and then integrate by parts. \([8]\) exploited a similar idea, but used it in a very different way. We also note that the spirit of this integration by parts is very similar to using the div-curl lemma, as in \([1, 9, 18, 19, 21]\), ..., but gives global results of strong convergence, in contrast with most of the above-mentioned compensated compactness results which only yield, strong but local convergence results.

In view of equation \((5.1)\) we define the following stream function \(\psi^\varepsilon\) by:

\[ \frac{\partial \psi^\varepsilon}{\partial x} = q^\varepsilon - r, \quad \frac{\partial \psi^\varepsilon}{\partial s} = -\left(q^\varepsilon v^\varepsilon + \frac{\partial r}{\partial x}\right), \quad \psi^\varepsilon(0, -\infty) = 0. \quad (6.1) \]
Using (6.1) and Lemma 5.2, we see that

\[ \psi^\varepsilon(0, x) = 0, \quad \frac{\partial}{\partial s} \psi^\varepsilon(s, \pm \infty) = -\rho_0(\pm \infty) V(s, \pm \infty) \], \quad \psi^\varepsilon(s, x) = O \left( \varepsilon + \frac{s}{\varepsilon} + \frac{s^2}{\varepsilon^2} \right) \quad (6.2) \]

Again, to control \( \psi^\varepsilon \) at infinity we introduce \( \Psi(s, x) := \varepsilon \exp \left( -\frac{s}{\varepsilon^2} \right) \rho_0(x)(u_{0,-\infty} + (u_{0,+\infty} - u_{0,\infty})H(x). \]

We note that \( \Psi(s, x) = O \left( \varepsilon \exp \left( -\frac{s}{\varepsilon^2} \right) \right) \), and that \( \frac{\partial \Psi}{\partial s} = -\rho_0 V. \]

We also need the following trivial result :

**Lemma 6.1** \( 2 \alpha \geq \beta \quad \implies \quad \int_0^{+\infty} \frac{s^\alpha}{\varepsilon^\beta} \exp \left( -\frac{s}{\varepsilon^2} \right) \, ds = O \left( \varepsilon^2 \right) \).

Now we use the stream function : multiply equation (5.2) by \( \psi^\varepsilon \) and integrate on \((0, S) \times (-L, L)\) to obtain

\[
\begin{align*}
\int_0^S \int_{-L}^{+L} \varepsilon^2 \partial_s (\phi^\varepsilon(v^\varepsilon - V)) \psi^\varepsilon \, dx \, ds &+ \int_0^S \int_{-L}^{+L} \varepsilon^2 \partial_x (\phi^\varepsilon(v^\varepsilon - V)^2) \psi^\varepsilon \, dx \, ds \\
&+ \int_0^S \int_{-L}^{+L} \partial_x (\phi^\varepsilon - r) \psi^\varepsilon \, dx \, ds \\
&+ \int_0^S \int_{-L}^{+L} \varepsilon^2 \partial_x (\phi^\varepsilon V(v^\varepsilon - V)) \psi^\varepsilon \, dx \, ds \\
&+ \int_0^S \int_{-L}^{+L} \varepsilon^2 \phi^\varepsilon \partial_x V \psi^\varepsilon \, dx \, ds \\
&:= A^\varepsilon + B^\varepsilon + C^\varepsilon + D^\varepsilon + E^\varepsilon = F^\varepsilon := \int_0^S \int_{-L}^{+L} -(\phi^\varepsilon(v^\varepsilon - V) + \partial_x r) \psi^\varepsilon \, dx \, ds,
\end{align*}
\]

We are going to estimate all the terms in (6.3), after having integrated by parts the terms \( A^\varepsilon \) to \( E^\varepsilon \), and then will pass to the limit when \( L \to \infty \). For clarity, we treat separately all these terms in the following Proposition, whose proof is postponed at the end of the paper, and then we add all these results, to obtain the key inequality and finally to prove Theorem 1.1.

**Proposition 6.1**

\[ |A^\varepsilon| = \left| \int_0^S \int_{-L}^{+L} \varepsilon^2 \frac{\partial}{\partial s} (\phi^\varepsilon(v^\varepsilon - V)\psi^\varepsilon) \, dx \, ds \right| \leq \frac{1}{4} \int_{-L}^{+L} (\psi^\varepsilon - \Psi)^2(S, x) \, dx + O \left( \varepsilon^2 \left( 1 + \Delta \sqrt{S} \right) \right) \quad (6.4) \]

\[ |B^\varepsilon| = \left| \int_0^S \int_{-L}^{+L} \varepsilon^2 \frac{\partial}{\partial x} (\phi^\varepsilon(v^\varepsilon - V)^2) \psi^\varepsilon \, dx \, ds \right| = O \left( \varepsilon^2 \left( 1 + \Delta \sqrt{S} \right) \right) \quad (6.5) \]

\[ C^\varepsilon = \int_0^S \int_{-L}^{+L} \left( \frac{\partial}{\partial x} (\phi^\varepsilon - r) \psi^\varepsilon \right) \, dx \, ds = - \int_0^S \int_{-L}^{+L} (\phi^\varepsilon - r)^2 \, dx \, ds \quad (6.6) \]

\[ |D^\varepsilon| = \left| \int_0^S \int_{-L}^{+L} \varepsilon^2 \frac{\partial}{\partial x} (\phi^\varepsilon V(v^\varepsilon - V)) \psi^\varepsilon \, dx \, ds \right| = O \left( \varepsilon^2 \right) \quad (6.7) \]

\[ |E^\varepsilon| = \left| \int_0^S \int_{-L}^{+L} \varepsilon^2 \phi^\varepsilon \frac{\partial V}{\partial x} \psi^\varepsilon \, dx \, ds \right| = O \left( \varepsilon^2 \right) \quad (6.8) \]

\[ \quad \quad F^\varepsilon = \int_0^S \int_{-L}^{+L} \left( -\phi^\varepsilon(v^\varepsilon - V) + \frac{\partial r}{\partial x} \right) \psi^\varepsilon \, dx \, ds = \int_{-L}^{+L} \frac{(\psi^\varepsilon - \Psi)^2}{2} \, (S, x) \, dx + O \left( \varepsilon^2 \right) \quad (6.9) \]
Proof of Theorem 1.1: We first rewrite equation (6.3) under the form
\[-C^\varepsilon + F^\varepsilon = A^\varepsilon + B^\varepsilon + D^\varepsilon + E^\varepsilon,\]
i.e:
\[-\int_0^S \int_{-L}^{+L} \partial_x (\varrho^\varepsilon - r) \psi^\varepsilon dxds + \int_0^S \int_{-L}^{+L} (\varrho^\varepsilon (v^\varepsilon - V) + \partial_x r) \psi^\varepsilon dxds =
\int_0^S \int_{-L}^{+L} \varepsilon^2 \partial_x (\varrho^\varepsilon (v^\varepsilon - V)) \psi^\varepsilon dxds + \int_0^S \int_{-L}^{+L} \varepsilon^2 \partial_x (\varrho^\varepsilon (v^\varepsilon - V)^2) \psi^\varepsilon dxds +
\int_0^S \int_{-L}^{+L} \varepsilon^2 \partial_x (\varrho^\varepsilon V (v^\varepsilon - V)) \psi^\varepsilon dxds + \int_0^S \int_{-L}^{+L} \varepsilon^2 \partial_x \varrho^\varepsilon \partial_x V \psi^\varepsilon dxds\]  
(6.10)
Adding the results of Proposition 6.1, (6.10) implies for all $S > 0$:
\[\int_0^S (\varrho^\varepsilon - r)^2 dxds + \frac{1}{4} \int_\mathbb{R} (\psi^\varepsilon - \Psi)^2 (S, x) dx \leq O \left( \varepsilon^2 \left( 1 + \Delta g \sqrt{S} \right) \right),\]  
(6.11)
which concludes the proof of Theorem 1.1.

7 Asymptotic behavior for large time

Theorem 1.1 gives a rate of convergence of $\varrho^\varepsilon$ to $r$ when $\varepsilon \to 0$, in the space $L^2((0, S) \times \mathbb{R})$. The question is now, to deduce a pointwise estimate in time, for fixed $\varepsilon$, from the integral estimates (1.8) and (1.9).

Now $\varepsilon$ is fixed, say $\varepsilon = 1$, and we write $(\rho, u)$ instead of $(\varrho^\varepsilon, u^\varepsilon)$. We begin by the easy proof of Corollary 1.1. Next, using some Hardy type Lemmas, see [7], and the entropy inequality we prove Theorem 1.2.

7.1 Proof of Corollary 1.1

We rewrite (1.8) under the form:
\[\frac{1}{T} \int_0^T \int_\mathbb{R} |\rho(t, x) - r(t, x)|^2 dxdt = O \left( \frac{1}{\sqrt{T}} \right).\]
The classical decay in $L^2$ for the heat equation:
\[\int_\mathbb{R} |r(t, x) - \tilde{r}(x/\sqrt{t})|^2 dx = O(1/\sqrt{t}),\]
which is sharp for $L^1$ initial data, implies (1.11).

Similarly, if $\rho_+ = \rho_-$ inequality (1.9) rewrites:
\[\int_0^{+\infty} h(t) dt < \infty, \text{ with } h(t) := \int_\mathbb{R} |\rho(t, x) - r(t, x)|^2 dx.\]
Using the chain rule formula for $BV$ functions, see [4, 27], we see that
\[\forall t \geq 1, \left| \frac{dh}{dt} \right| \leq 2 \left\| \rho - r \right\|_{L^\infty} \int_\mathbb{R} |\partial_t \rho - \partial_t r(t, x)| dx \leq C.\]
Therefore, $h$ is Lipschitz continuous and integrable on $(0, +\infty)$. Consequently $h(t) \to 0$ as $t \to \infty$. And, finally, $\int_\mathbb{R} |r(t, x) - \rho_\infty|^2 dx = O(1/\sqrt{t})$, which concludes the proof of Corollary 1.1.

7.2 Estimates à la Hardy

Here is a first useful result, see [9] (pp 365-366), and see [25] for related ideas.
Lemma 7.1 ([9])

Let $g$ and $v$ be nonnegative functions defined on $[0, +\infty]$, and $C$ be a positive constant.

Assume that $\lim_{T \to +\infty} \frac{1}{T} \int_0^T g(t)dt = 0$, and $\frac{dg}{dt}(t) \leq \frac{C}{t}$, $0 < t$.

Then for any $D > \sqrt{2C}$, and for large $T$, $g(T) \leq D \sqrt{\frac{1}{T} \int_0^T g(t)dt}$.

For convenience we recall the proof given in [9].

**Proof:** Let $T > 0$ fixed and $\tau$ given by $C \ln(T/\tau) = g(T)$, i.e. $\tau := T \exp(-g(T)/C) \leq T$. Let $h(t) := g(t) - C \ln(t)$ then $h'(t) \leq 0$. Since

$$(T - \tau)h'(T) = \int_T^\tau (t - \tau)h'(t)dt + \int_\tau^T h(t)dt,$$

we have $(T - \tau)h(T) \leq \int_\tau^T h(t)dt$.

Therefore, $(T - \tau)(g(T) - C \ln(T)) \leq \int_0^T g(t)dt - C \int_\tau^T \ln(t)dt$, and finally:

$$(T - \tau)g(T) - (T - \tau)C \ln(T) + C \int_\tau^T \ln(t)dt \leq \int_0^T g(t)dt. \quad (7.1)$$

Introducing $\Lambda(s) := \exp(-s) + s - 1$ with $s := g(T)/C$, (7.1) rewrites, after a few calculations: under the form $\Lambda \left( \frac{g(T)}{C} \right) \leq \frac{1}{CT} \int_0^T g(t)dt$, which implies the result for any $D > \sqrt{2C}$, since $\Lambda^{-1}(s) \sim \sqrt{2s}$ when $s \to 0$. \hfill \Box

We are now able to deduce the following lemma for the weighted Cesaro mean value.

**Lemma 7.2** Let $h \geq 0$ defined on $(0, +\infty)$, $c$ a positive constant, and $\alpha, \beta, \gamma$ nonnegative constants.

Assume that:

$$\frac{1}{T} \int_0^T t^\alpha h(t)dt \leq \frac{c}{T^\beta}, \quad T > 0,$$

and $\frac{dh}{dt}(t) \leq \frac{c}{t^\alpha}$, $t > 0$, and $\alpha \leq 1 < \alpha + \beta + \gamma$.

Then $h(T) \to 0$ when $T \to +\infty$. More precisely:

$$\exists C > 0; \quad h(T) \leq CT^{-\mu}, \quad \text{where } \mu := \frac{\alpha + \beta + \gamma - 1}{2}.$$ 

**Proof:** Let be $g(t) := t^{\alpha-1}h(t)$, then $dg/dt = O(1/t)$, since $h(t) \leq h(0) + c t^{1-\alpha}/(1 - \alpha)$ for $\alpha < 1$, and $1/T \int_0^T t^{\gamma+1-\alpha}g(t)dt = O(1/T^\beta)$. Define $s := t^\lambda$, $S := T^\lambda$, with $\lambda := \gamma + 2 - \alpha > 0$, $\nu := (\beta + \gamma + 1 - \alpha)/\lambda > 0$, and $f(s) := g(t)$.

Then $\frac{1}{S} \int_0^S f(s)ds \leq \frac{c}{S^{\nu}}$. Since $t ds = \lambda s dt$, we have $\frac{df}{ds} = \frac{dg}{dt}(t) \frac{dt}{ds} \leq \frac{c}{\lambda s}$. So, by Lemma (7.1), $f(S) \leq CS^{-\nu/2}$, which concludes the proof, since $h(T) = T^{1-\alpha} f(T^\lambda)$.

**7.3 Proof of Theorem 1.2**

Let us establish the estimates (1.13) to (1.16).
(i) **Proof of inequality (1.13)**: By inequality (1.11), we obtain \( \frac{1}{T} \int_0^T t^{1/2} \overline{h}(t) dt \leq \frac{C}{T^{1/2}} \), where 
\( \overline{h}(t) := \int_{\mathbb{R}} |\rho(t, z \sqrt{t}) - \tau(z)|^2 dz \).
On the other hand,
\[
d\overline{h}/dt = 2 \int_{\mathbb{R}} (\rho - \tau) (\partial_t \rho - 1/2 \sqrt{t} \partial_z \rho) (t, z \sqrt{t}) dz = O(1/\sqrt{t}),
\]
using the BV estimates for the density we obtain, since \( dz = dx / \sqrt{t} \), which implies (1.13) by Lemma 7.2. \( \square \)

(ii) **Proof of inequality (1.15)**: Set \( h(t) := \int_{\mathbb{R}} |\rho - r|^2(t, z \sqrt{t}) dz \).
By inequality (1.9), \( \int_0^{+\infty} t^{1/2} h(t) dt < +\infty \), i.e.: \( \frac{1}{T} \int_0^T t^{1/2} h(t) dt \leq \frac{C}{T} \) and \( dh/dt = O(1/\sqrt{t}) \). Then, by Lemma 7.2, \( h(t) = O(1/\sqrt{t}) \). Furthermore, any solution to the heat equation converges towards a self-similar solution: \( \int_{\mathbb{R}} \rho(t, z \sqrt{t}) - \tau(z) \|^2 dz \leq 1/t \). We then can replace \( \rho \) by the self-similar solution \( \tau \) without losing any rate on the decay. \( \square \)

(iii) **Proof of inequalities (1.14), (1.16)**:
First of all, we need a "localised" entropy inequality to get a better rate of decay.
Following [9], we use a test function to control the entropy on boundary of the parabolic domain \( \{|x|^2 \leq Lt\} \), \( L > 0 \) be fixed and \( \chi(x) := 1 \) if \( |x| \leq 1 \), \( \chi(x) := 0 \) if \( |x| \geq 2 \). Defining:
\[
H(t) := \frac{1}{\sqrt{t}} \int_{|x|\leq 2L} [\theta \varphi] (t, x) dx, \quad \text{where} \quad \theta(t, x) := \chi \left( \frac{x}{L \sqrt{t}} \right).
\]
And following [9], we obtain:

**Lemma 7.3** There exists \( c \) such that \( \frac{dH}{dt}(t) \leq \frac{c}{t} \), \( 0 < t \).

On the other hand, by Corollary 1.1,

**Lemma 7.4** There exists \( c \) such that \( \forall T > 0 \), \( \frac{1}{T} \int_0^T \sqrt{t} H(t) dt \leq c \left( \frac{\Delta \varphi}{\sqrt{t}} + \frac{1}{T} \right) \).

**Proof**: Using \( L^\infty \) bounds of \( \varphi \) and \( r \) and the quadratic behavior of \( \varphi \) at \( \varphi = r \), we first have:
\[
\delta (\varphi - r)^2 \leq \varphi (\varphi) \leq \delta^{-1} (\varphi - r)^2
\tag{7.2}
\]
for some constant \( \delta \). Then,
\[
\frac{1}{T} \int_0^T \sqrt{t} H(t) dt = \frac{1}{T} \int_0^T \int_{\mathbb{R}} \theta \varphi (\varphi) dx \leq \frac{1}{T} \int_0^T \int_{|x|\leq 2L \sqrt{t}} \varphi (\varphi) dx \leq \frac{1}{T} \int_0^T \int_{|x|\leq 2L \sqrt{t}} \delta^{-1} (\varphi - r)^2 dx \leq \frac{C}{\delta \sqrt{t}} \quad \square
\]

Now we can establish inequalities (1.14), (1.16). Using the above Lemmas 7.2 to 7.4, we obtain \( H(t) = O \left( 1/\sqrt{t} \right) \). Using inequality (7.2), and replacing \( r \) by \( \tau \), we conclude the proof of Theorem 1.2. \( \square \)
8 Appendix 1: Proof of Proposition 6.1

Proof of (6.4):

\[ A^\varepsilon = \int_0^S \int_{-L}^{+L} \varepsilon^2 \frac{\partial}{\partial s} (\varphi^\varepsilon (v^\varepsilon - V)) \psi^\varepsilon dx ds := a + b + c := \int_0^S \int_{-L}^{+L} \varepsilon^2 \varphi^\varepsilon (v^\varepsilon - V) \left( \varphi^\varepsilon \psi^\varepsilon \right) dx ds \]
\[ + \int_0^S \int_{-L}^{+L} \varepsilon^2 \varphi^\varepsilon (v^\varepsilon - V) \left( \partial_x r \right) dx + \int_{-L}^{+L} \varepsilon^2 (\varphi^\varepsilon (v^\varepsilon - V) \psi^\varepsilon (S, x)) dx. \]

We treat separately these three terms. To control (a), we use inequality (4.3), Proposition 3.1, and Lemma 5.3.

\[ a := \int_0^S \int_{-L}^{+L} \varepsilon^2 \varphi^\varepsilon (v^\varepsilon - V) \left( \varphi^\varepsilon \psi^\varepsilon \right) dx ds \]
\[ = \int_0^S \int_{-L}^{+L} \varepsilon^2 (\varphi^\varepsilon)^2 (v^\varepsilon - V)^2 dx ds + \int_0^S \int_{-L}^{+L} \varepsilon^2 (\varphi^\varepsilon)^2 (v^\varepsilon - V) V dx ds \]
\[ = O \left( \varepsilon^2 \left( 1 + \Delta \varphi \sqrt{S} \right) \right) + O(1) \int_0^S \varepsilon O \left( 1 + \frac{1}{\varepsilon} \exp \left( -\frac{S}{\varepsilon^2} \right) \exp \left( -\frac{S}{\varepsilon^2} \right) ds = O \left( \varepsilon^2 \left( 1 + \Delta \varphi \sqrt{S} \right) \right). \]

As to (b), by Proposition 4.1 and Lemma 4.1, we obtain

\[ b := \int_0^S \int_{-L}^{+L} \varepsilon^2 \varphi^\varepsilon |v^\varepsilon - V| |\partial_x r| dx ds \leq \varepsilon^2 \left( \frac{1}{2} \int_0^S \int_{-L}^{+L} (\varphi^\varepsilon)^2 (v^\varepsilon - V)^2 dx ds + \frac{1}{2} \int_0^S \int_{-L}^{+L} (\partial_x r)^2 dx ds \right) \]
\[ = O \left( \varepsilon^2 \left( 1 + \Delta \varphi \sqrt{S} \right) \right). \]

Now we use inequality (4.4). First, observe that:

\[ c := \int_{-L}^{+L} \varepsilon^2 \varphi^\varepsilon (v^\varepsilon - V) (\psi^\varepsilon (S, x) - \Psi) dx + \int_{-L}^{+L} \varepsilon^2 \varphi^\varepsilon (v^\varepsilon - V) \Psi (S, x) dx = c_1 + c_2. \]

We control \( c_1 \) by the classical inequality: \( \nu > 0, \alpha \beta \leq \frac{\nu}{2} \alpha^2 + \frac{1}{2 \nu} \beta^2 \), with \( \nu = 2, \alpha = \varepsilon^2 \varphi^\varepsilon (v^\varepsilon - V), \beta = \psi^\varepsilon - \Psi \). Therefore, in view of (4.1)

\[ |c_1| \leq \varepsilon^2 \int_{-L}^{+L} \varphi^\varepsilon (v^\varepsilon - V)^2 dx + \frac{1}{4} \int_{-L}^{+L} (\psi^\varepsilon - \Psi)^2 (S, x) dx \]
\[ \leq O \left( \varepsilon^2 \left( 1 + \Delta \varphi \sqrt{S} \right) \right) + \frac{1}{4} \int_{-L}^{+L} (\psi^\varepsilon - \Psi)^2 (S, x) dx. \]

On the other hand, by Lemma 5.1, the \( L^1 \) bound on \( (v^\varepsilon - V) \) and the exponential decay of \( V \) imply:

\[ |c_2| \leq \int_{-L}^{+L} \varepsilon^2 O \left( 1 + \frac{1}{\varepsilon} \exp \left( -\frac{S}{\varepsilon^2} \right) \right) \exp \left( -\frac{S}{\varepsilon^2} \right) dx = O \left( \varepsilon^2 \left( 1 + \Delta \varphi \sqrt{S} \right) \right). \]

Finally \( c = c_1 + c_2 \) is bounded by

\[ |c| = \int_{-L}^{+L} \varepsilon^2 \varphi^\varepsilon |(v^\varepsilon - V)\psi^\varepsilon| (S, x) dx \leq O \left( \varepsilon^2 \left( 1 + \Delta \varphi \sqrt{S} \right) \right) + \frac{1}{4} \int_{-L}^{+L} (\psi^\varepsilon - \Psi)^2 (S, x) dx, \]

15
and (6.4) follows.

**Proof of (6.5):** Since \( \lim_{L \to +\infty} \int_0^S [\varepsilon^2 \varrho^\varepsilon (v^\varepsilon - V)^2 \psi^\varepsilon (s, \cdot)]_L^+ ds = 0 \), we have by (4.4).

\[
\lim_{L \to +\infty} \int_0^S \int_{-L}^{+L} \left( \varepsilon^2 \frac{\partial}{\partial x} \left( \varrho^\varepsilon (v^\varepsilon - V)^2 \right) \psi^\varepsilon \right) dx ds = - \lim_{L \to +\infty} \int_0^S \int_{-L}^{+L} \varepsilon^2 \varrho^\varepsilon (v^\varepsilon - V)^2 (\varrho^\varepsilon - r) dx ds
\]

\[
= O \left( \varepsilon^2 \left( 1 + \Delta \varrho \sqrt{S} \right) \right).
\]

**Proof of (6.6):** This Lemma is obvious. Note that at this stage we do not yet know if \((\varrho^\varepsilon - r)^2 \in L^2\). The key point to prove (6.7) and (6.8) is the exponential decay in time of \(V\).

**Proof of (6.7):** Using the \(L^1\) estimate of \((v^\varepsilon - V)\), the \(L^\infty\) bound of \(\psi^\varepsilon\), the fast decay of \(V\), we obtain after integration by parts:

\[
D^\varepsilon = \int_0^S \int_{-L}^{+L} \varepsilon^2 \frac{\partial}{\partial x} (\varrho^\varepsilon V (v^\varepsilon - V)) \psi^\varepsilon dx ds
\]

\[
= - \int_0^S \int_{-L}^{+L} \varepsilon^2 \varrho^\varepsilon V (v^\varepsilon - V) (\varrho^\varepsilon - r) dx ds + \int_0^S \varepsilon^2 \varrho^\varepsilon V (v^\varepsilon - V) \psi^\varepsilon (s, \cdot)]_L^+ ds
\]

\[
\to O(1) \int_0^S \varepsilon O \left( 1 + \frac{1}{\varepsilon} \exp \left( - \frac{s}{\varepsilon^2} \right) \right) \exp \left( - \frac{s}{\varepsilon^2} \right) ds + O \left( \varepsilon^2 \right) = O \left( \varepsilon^2 \right).
\]

L \to +\infty

**Proof of (6.8):** Using the same estimate, we get similarly,

\[
|E^\varepsilon| = \left| \int_0^S \int_{-L}^{+L} \varepsilon^2 \varrho^\varepsilon v^\varepsilon \frac{\partial V}{\partial x} \psi^\varepsilon dx ds \right| = O \left( 1 \right) \int_0^S \varepsilon^2 \frac{1}{\varepsilon} \exp \left( - \frac{s}{\varepsilon^2} \right) \left( \varepsilon + \frac{s}{\varepsilon} + s \frac{1}{2} \right) ds
\]

\[
= O \left( 1 \right) \int_0^S \left( \varepsilon + \frac{s}{\varepsilon} + s \frac{1}{2} \right) \exp \left( - \frac{s}{\varepsilon^2} \right) ds = O \left( \varepsilon^2 \right).
\]

**Proof of (6.9):** First observe that

\[
- \left( \varrho^\varepsilon (v^\varepsilon - V) + \frac{\partial r}{\partial x} \right) \psi^\varepsilon = (\partial_s \psi^\varepsilon + \varrho^\varepsilon V) \psi^\varepsilon = (\partial_s \psi^\varepsilon + \rho_0 V) \psi^\varepsilon + (\varrho^\varepsilon - \rho_0) V \psi^\varepsilon := e + f.
\]

By the same arguments \((f)\) is \(O \left( \varepsilon^2 \right)\) in \(L^1((0, +\infty) \times \mathbb{R})\). As to \((e)\), by (6.2), we have

\[
(\partial_s \psi^\varepsilon + \rho_0 V) \psi^\varepsilon = (\partial_s \psi^\varepsilon - \partial_s \psi)(\psi^\varepsilon - \Psi + \Psi) = \partial_s \left( \frac{(\psi^\varepsilon - \Psi)^2}{2} \right) + \psi(\partial_s \psi^\varepsilon + \rho_0 V) := g + h.
\]

We now control \(h = \Psi(\partial_s \psi^\varepsilon + \rho_0 V)\) as follows:

\[
\Psi(\partial_s \psi^\varepsilon + \rho_0 V) = \Psi(-\varrho^\varepsilon v^\varepsilon - \partial_x r + \rho_0 V) = -\Psi(\varrho^\varepsilon v^\varepsilon - \rho_0 V) - \Psi \partial_x r,
\]

we keep the term \((g)\), which will give us a very nice information. The first term is obvious by Lemma (5.3) and the second one is controlled by (4.7). Finally, Proposition 6.1 is now completely proved. □
9 Appendix 2: Proof of Lemma 7.3

First, we prove a localised entropy inequality, following [9]. Using the notations of section 4 with \( \varepsilon = 1 \), in particular \( V \) is defined by (4.1), we obtain, with similar calculations, the following result

**Lemma 9.1** Let \( L > 0 \), then, there exists \( c \) such that

\[
\partial_t \left( \rho (u - V)^2 / 2 + \varphi (\rho) \right) + \partial_x \left( \rho (u - V)^3 / 2 \right) + \partial_x \left( \rho (u - V) (\ln \rho - \ln r) \right) + \rho (u - V)^2 \leq R,
\]

with

\[
\int_{|x| \leq L \sqrt{T}} R(T, x) dx \leq \frac{c}{\sqrt{T}}, \quad T > 0.
\]

**Proof** : We follow the proof of Lemma 4.2 with small modifications. We have:

\[
\partial_t (\rho \ln \rho) = \partial_t \varphi (\rho) - \psi (r) \partial_x (\rho u) + R_I, \quad \text{where} \quad \int \mathbb{R} |R_I|(t, x) dx = O \left( \frac{1}{\sqrt{T}} \right), \quad (9.1)
\]

since \( \psi (\rho) = \rho \ln \rho = \varphi (\rho) + \psi (r) \rho (\varphi (r) - r) \partial_t (r), \partial_t \psi (\rho) = \partial_t \varphi (\rho) + \psi (r) \partial_t (\rho) + \psi (r) (\varphi (r) - r) \partial_t (r), \) and

\[
\psi (r) (\varphi (r) - r) \partial_t (r) = O (\partial_t (r)), \quad \int \mathbb{R} |\partial_t (r)|(t, x) dx = O \left( \frac{1}{\sqrt{T}} \right).
\]

\[
\partial_t (\rho u^2 / 2) = \partial_t (\rho (u - V)^2 / 2) R_{II}, \quad \text{where} \quad \int \mathbb{R} |R_{II}|(t, x) dx = O \left( \exp (-t) \right) \quad (9.2)
\]

since \( R_{II} = \partial_t (\rho (u - V)V) + \rho (u - V) \partial_t V + \partial_t (\rho V^2 / 2) \), and \( |V| + |\partial_t V| = O (\exp (-t)) \). In the same way

\[
\partial_t (\rho u^3 / 2) = \partial_t (\rho (u - V)^3 / 2) R_{III}, \quad \text{where} \quad \int \mathbb{R} |R_{III}|(t, x) dx = O \left( \exp (-t) \right) \quad (9.3)
\]

since \( \partial_x V = O (\exp (-t)) \). Using entropy inequality (4.9) and adding up (9.1), (9.1), (9.3), we conclude the proof of this Lemma. \( \square \)

Now, we can achieve the **proof of Lemma 7.3**:

Let be \( \chi (x) := \exp (1 / 3) \exp \left( - (4 - x^2)^{-1} \right) \) if \( 1 < |x| < 2 \), then \( \frac{(\chi')^2}{\chi} \) is bounded.

From the entropy inequality of Lemma 9.1, we get

\[
\left[ \partial_t \left( \theta (u - V)^2 / 2 + \varphi (\rho) \right) \right] + \left[ \partial_x \left( \theta (u - V)^3 / 2 + \varphi (\rho (u - V))(\ln \rho - \ln r) \right) \right] + \left[ \theta \rho (u - V)^2 \right] \quad (9.4)
\]

\[
\leq \theta R + \left( \partial_t \theta \right) (u - V)^2 / 2 + \varphi (\rho) + \left( \partial_x \theta \right) (u - V)^3 / 2 + \left( \partial_x \theta \right) (u - V)(\ln \rho - \ln r) \quad (9.5)
\]

i.e. \( a + b + c \leq d + e + f + g \). Let \( A = A(t) := \int_{|x| \leq L \sqrt{T}} a(t, x) dx \), \( \ldots \), \( G = G(t) := \int_{|x| \leq L \sqrt{T}} g(t, x) dx \).

We have clearly \( D(t) = O (1 / \sqrt{T}) \). Since \( \partial_t \theta = 0 (1 / t) \), we have also \( E(t) = O (1 / \sqrt{T}) \).

\[
(\partial_x \theta) (u - V)^2 / 2 = (\theta (u - V)^2 / 100) \times (\partial_x \theta)(u - V), \quad \text{then by Young inequality and the fact that} \quad \partial_x \theta = O (1 / \sqrt{T}), \quad F \text{ is controlled by } C.
\]

\[
g = \left( \sqrt{\theta \rho (u - V)} \right) \times \left( (\partial_x \theta) (\ln \rho - \ln r) \right) \sqrt{\rho} \leq \theta \rho (u - V)^2 / 2 + \frac{(\partial_x \theta)^2}{\theta} \rho \ln (\rho / r).
\]

The first term of the right hand side is controlled by \( c \) and the last term is \( O (1 / t) \), since \( (\partial_x \theta)^2 / \theta = O (1 / t) \), then \( G(t) = O (1 / \sqrt{T}) \).

Adding all the previous results, the inequality (9.4) become

\[
\int_{|x| \leq L \sqrt{T}} \partial_t (\theta \varphi (\rho)) dx + \int_{|x| \leq L \sqrt{T}} \theta \rho (1 - 1 / 2 - 1 / 100)(u - V)^2 dx \leq O \left( \frac{1}{\sqrt{T}} \right), \quad \text{which conclude the proof of this Lemma.} \quad \square
\]

**Acknowledgements** : This research was partially supported by TMR project HCL.
10 Appendix 3: Proof of Proposition 3.1

For convenience, we briefly recall or adapt below the main steps of the proof.

**Step 1**: For each fixed $\varepsilon > 0$, we rewrite system (1.18), (1.19) in the original $(t,x)$ variables, and we use the same splitting as in [23]:

$$
\begin{align*}
(i) \quad & \frac{\partial \rho^\varepsilon}{\partial t} + \frac{\partial}{\partial x} (\rho^\varepsilon u^\varepsilon) = 0, \\
& \frac{\partial (\rho^\varepsilon u^\varepsilon)}{\partial t} + \frac{\partial}{\partial x} (\rho^\varepsilon (u^\varepsilon)^2 + \rho^\varepsilon) = 0,
(ii) \quad & \frac{\partial \rho^\varepsilon}{\partial t} = 0, \\
& \frac{\partial u^\varepsilon}{\partial t} = -\frac{u^\varepsilon}{\varepsilon}.
\end{align*}
$$

System (10.1) (i) is the celebrated Nishida system, written in Eulerian coordinates. Next we briefly recall how these properties are preserved with the above-mentioned splitting.

**Step 2**: The simplified (Glimm) functional for the Nishida system

We follow here the presentation of [23]. Consider the Riemann problem for the system (10.1) (i) with data $U_-(\rho_-, u_-)$ and $U_+(\rho_+, u_+)$

$$
U(0,x) = (\rho(0,x),u(0,x)) = \begin{cases} U_- & \text{if } x < 0, \\
U_+ & \text{if } x > 0,
\end{cases}
$$

The solution consists of two simple waves, separated by an intermediate constant state $U_0$. Let us introduce $\eta := \ln \rho$, and $f(\eta) := \begin{cases} 2 \sinh \left( \frac{\eta}{2} \right) & \eta \geq 0 \\
\eta & \eta \leq 0
\end{cases}$. The intermediate constant state $U_0$ is uniquely determined by (10.2)

$$
u_- - u_0 = f(\eta_0 - \eta_-), \quad u_0 - u_+ = f(\eta_0 - \eta_+),
$$

(10.2)

Let us now define the simplified functional: $S(U_-, U_+) := |\eta_0 - \eta_-| + |\eta_0 - \eta_+|$. Since $\eta$ is monotone across simple waves, we have: $\forall t > 0$, $TV\eta(t,.) = S(U_-, U_+)$. The following Lemma controls $S(U_-, U_+)$ in terms of the strength of the jumps in the initial data.

**Lemma 10.1** $S(U_-, U_+) \leq \max(|u_- - u_+|, |\eta_- - \eta_+|)$.

**Proof**: We treat the four cases:

- **(i)** If $\eta_- \leq \eta_0 \leq \eta_+ \leq \eta_-$, we have: $S(U_-, U_+) = |\eta_0 - \eta_-| + |\eta_0 - \eta_+| = |\eta_- - \eta_+|$.
- **(ii)** If $\eta_0 \leq \eta_- \leq \eta_0 \leq \eta_+$, we have: $|u_0 - u_-| = |\eta_0 - \eta_-|$, $|u_0 - u_+| = |\eta_0 - \eta_+|$, and $u_+ \leq u_0 \leq u_-$ by (10.2), since $\eta_0 - \eta_- \leq 0$ and $\eta_0 - \eta_+ \leq 0$. Then, we have: $S(U_-, U_+) = |\eta_0 - \eta_-| + |\eta_0 - \eta_+| = |u_0 - u_-| + |u_0 - u_+| = |u_- - u_+|$.
- **(iii)** If $\eta_0 \geq \eta_- \geq \eta_0 \geq \eta_+$, we have: $|u_0 - u_-| = f(|\eta_0 - \eta_-|)$, $|u_0 - u_+| = f(|\eta_0 - \eta_+|)$, and $u_+ \geq u_0 \geq u_-$ by (10.2), since $\eta_0 - \eta_- \geq 0$ and $\eta_0 - \eta_+ \geq 0$. Then, using the fact that $|\eta| \leq f(|\eta|)$, we have:

$$
\begin{align*}
S(U_-, U_+) &= |\eta_0 - \eta_-| + |\eta_0 - \eta_+| \leq f(|\eta_0 - \eta_-|) + f(|\eta_0 - \eta_+|) \\
&\leq |u_0 - u_-| + |u_0 - u_+| \leq |u_- - u_+|.
\end{align*}
$$

\[\blacksquare\]
Step 3: Extension to the full system
Let $\varepsilon > 0$ be fixed. Again we follow [23], and the above-mentioned references. At each time step $t_n$, the splitting is the following:
(i) starting with piecewise constant data $U^n := (\rho^n, u^n) := \{(\rho_i^n, u_i^n), i \in \mathbb{Z}\}$ we first construct a new piecewise constant function $\bar{U}^{n+1} := (\bar{\rho}^n, \bar{u}^n) := \{(\bar{\rho}_i^n, \bar{u}_i^n), i \in \mathbb{Z}\}$ by the Glimm scheme.
(ii) starting now with this new initial data $\bar{U}^{n+1}$, we solve the stiff ordinary differential equation (10.1) from $t_n$ to $t_{n+1}$, to construct the approximation $\tilde{U}^{n+1}$ at time $t_{n+1}$. In other words,
$$
\rho_i^{n+1} = \bar{\rho}_i^{n+1}, \quad u_i^{n+1} = \exp(-k/\varepsilon) \bar{u}_i^{n+1},
$$
where $k = \Delta t$ is the time step.
Now define $S(U_-, U_+) := |\eta_0 - \eta_-| + |\eta_0 - \eta_+|$, and the simplified Glimm functional
$$
N^n := \sum_{i \in \mathbb{Z}} S(\bar{U}_i^{n+1}, \bar{U}_{i+1}^{n+1}),
$$
which controls the total variation of the numerical solution. We recall that the total variation of a function $g : \mathbb{R} \to \mathbb{R}$ is:
$$
TV(g) := \sup_{n \in \mathbb{N}, \ x_0 < x_1 < \cdots < x_n} \sum_{i=1}^{n} |g(x_i) - g(x_{i-1})|.
$$
The following result is proven in [23].

**Lemma 10.2 ([23])** For any fixed $\alpha \in [0, 1]$, and for any $\bar{U}_\pm := (\rho_\pm, u_\pm)$ let us define $U_\pm := (\rho_\pm, \alpha u_\pm)$, then $S(U_-, U_+) \leq S(\bar{U}_-, \bar{U}_+)$. Using this result, we obtain finally the following crucial estimates

**Lemma 10.3** \(\forall n \geq 0, \quad N^n \leq TV(u_0) + TV(\ln \rho_0).\)

**Proof**: Combining Lemma 10.2 with the well-known estimates on the Nishida system, we easily obtain for $n \geq 1$, $N^n = \sum_{i \in \mathbb{Z}} S(\bar{U}_i^{n+1}, \bar{U}_{i+1}^{n+1}) \leq \sum_{i \in \mathbb{Z}} S(\bar{U}_i^{n+1}, \bar{U}_{i+1}^{n+1}) \leq \sum_{i \in \mathbb{Z}} S(\bar{U}_i^n, \bar{U}_{i+1}^n) = N^{n-1}$. Moreover, we can control $N^0$ in term of the total variation of the initial data, uniformly with respect to $\varepsilon$ and to the mesh size $h$. First, we note that for all sequences of nonnegative numbers $a_j$ and $b_j$, we have $\sum_{i \in \mathbb{Z}} \max(a_j, b_j) \leq \sum_{i \in \mathbb{Z}} a_j + \sum_{i \in \mathbb{Z}} b_j$. Therefore, $N^0 \leq TV(u_0) + TV(\ln \rho_0)$ follows, by Lemma 10.1. $\square$

We are now able to prove Proposition 3.1.

Step 4: Proof of Proposition 3.1
By Lemma 10.3 we know that $(N^n)$ is bounded, uniformly in $h$, $\varepsilon$ and $n$, and therefore in time. Therefore, the family of approximated solutions $(U_h^n)_{h \to 0+}$ constructed by the above scheme satisfies, uniformly in $h$ and $\varepsilon$:
$$
\sup_{t \geq 0} TV(\eta(U_h^n)(t, \cdot)) \leq N^0,
$$
where we recall that $\eta(\rho, u) := \ln(\rho)$. Since the limits of $\eta(U(t, x))$ at $x = \pm \infty$ do not depend on $t$, we obtain a $L^\infty$ bound for $\eta = \ln \rho$, uniform in $\varepsilon$ and $h$. We also note that $f \in C^1(\mathbb{R})$ and $f(0) = 0$, so that $|u_\pm - u_0| \leq f'(|\eta_\pm - \eta_0|)|\eta_\pm - \eta_0|$. Using the previous inequality for the first step of the
splitting and combining with (10.1), we deduce that $u$ is also bounded in $BV$, uniformly in $h$ and $\varepsilon$. The velocity $u$ is therefore uniformly bounded in $L^\infty$, since its limit values at $x = \pm \infty$ are uniformly bounded by $[u_0(\pm \infty)]$, which concludes the proof of Proposition 3.1 for approximate solutions. Therefore we can pass to the limit as $h \to 0$, to get the same $L^\infty$ and $BV$ estimates for the weak entropy solution $U^\varepsilon := (\rho^\varepsilon, u^\varepsilon)$, uniformly in $\varepsilon$. Of course, these estimates also hold true with the new time $s$. □
