## Final examination, (MPA $\cup$ MATHMODS), B

Documents and calculators forbidden. Give back the subject with your copy.

1. QuIZ (Write the answers on the examination copy, without justification (this is a quiz). One answer per question. One point per good answer (zero point for a bad answer).
(1) What is the purpose of performing cross-validation?
(a) To assess the predictive performance of the models .
(b) To judge how the trained model performs outside the sample on test data.
(c) Both 1 and 2.
(2) Which of the following is an example of a deterministic algorithm?
(a) Logistic Regression.
(b) $K$-Means.
(c) None of the above.
(3) We do a linear regression. Which of the following is true in the context of regularization/penalization?
(a) Ridge regression can reduce the parameters to zero.
(b) Ridge regression is also called $L 1$ regularization.
(c) Lasso regression can reduce the parameters to zero.
(d) None of the above.
(4) Which of the following is NOT supervised learning?
(a) Principal Component Analysis.
(b) Naïve Bayes Classifier.
(c) Linear Regression.
(5) It is an iterative algorithm that tries to partition the dataset into $K$ pre-defined distinct non-overlapping subgroups (clusters) where each data point belongs to only one group. It is one of the simplest unsupervised learning algorithms that solve the well-known clustering problem. This clustering only works with numeric data. Which clustering has been discussed here?
(a) $K$-nearest neighbor
(b) $K$-clustering
(c) $K$-means
(6) To find the minimum or the maximum of a function, we set the gradient to zero because
(a) The value of the gradient at extrema of a function is always zero.
(b) Depends on the type of problem.
(c) Both (a) and (b).
(7) I plot the loss error during the learning phase of my neural network (the spiky line in Figure 1.1). The loss error is the sum of the squares of the distances between what the network produces and the output (which is known on the training set). I also plot the loss error on a validation set (a set for which I know the output) (the smooth line in Figure 1.1).
(a) I am over-fitting.
(b) I am under-fitting.
(c) None of the above, I am good.
(8) Assuming that you have a very large training set, which of the following algorithms do you think can be parallelized using map-reduce and splitting the training set across different machines?
(a) A neural network trained using batch gradient descent.
(b) Linear regression trained using batch gradient descent.

Figure 1.1. Loss error
(c) Logistic regression trained using stochastic gradient descent.
(9) Which of the following statements about regularization is not correct? (We add a penalization/regularization term multiplied by $\lambda$.)
(a) Using too large a value of lambda can cause your model to under-fit the data.
(b) Using too large a value of lambda can cause your model to over-fit the data.
(c) Using a very large value of lambda cannot hurt the performance of your model.
(10) Imagine, you are solving a classification problems with highly imbalanced class. The majority class is observed $99 \%$ of times in the training data. Your model has $99 \%$ accuracy after taking the predictions on test data. Which of the following is true in such a case?
(a) My model is good.
(b) My model is bad.

## 2. More difficult questions (five points for each exercise)

Exercise 1. We have a random variable $\Theta$ in $\mathbb{R}^{+}$with density: $x \in \mathbb{R}^{+} \mapsto e^{-x}$. We have a Markov chain $\left(X_{k}\right)_{k \geq 0}$ such that

- $X_{0}=0$
- 

$$
X_{k+1}= \begin{cases}X_{k} & \text { with probability } 1-\Theta \\ X_{k}+U_{k} & \text { with probability } \Theta / 2 \\ X_{k}-U_{k} & \text { with probability } \Theta / 2\end{cases}
$$

where the $\left(U_{k}\right)$ are independent, with the same law $\mathcal{N}(0,1)$.
We have observations (for all $k$ )

$$
Y_{k}=X_{k}+V_{k}
$$

where the $\left(V_{k}\right)$ are independent (and independent of the $\left(U_{k}\right)$ ), with the same law $\mathcal{N}(0,1)$.
For random variables $A, B$, we use the following notation: $\mathbb{P}(A=a)$ is the density of $A$ taken in $a, \mathbb{P}(A=a \mid B=b)$ is the density of $\mathcal{L}(A \mid B=b)$ taken in $b$.

We suppose we have observations $Y_{0}=y_{0}, Y_{1}=y_{1}, \ldots, Y_{n}=y_{n}$ (for some $n$ ) that are fixed.
(1) Using the Bayes formula, show that

$$
\mathbb{P}\left(\left(X_{k}\right)_{0 \leq k \leq n}=\left(x_{k}\right)_{0 \leq k \leq n}, \Theta=\theta \mid\left(Y_{k}\right)_{0 \leq k \leq n}=\left(y_{k}\right)_{0 \leq k \leq n}\right)
$$

is proportional to

$$
\begin{aligned}
& \mathbb{P}\left(\left(Y_{k}\right)_{0 \leq k \leq n}=\left(y_{k}\right)_{0 \leq k \leq n} \mid\left(X_{k}\right)_{0 \leq k \leq n}=\left(x_{k}\right)_{0 \leq k \leq n}, \Theta=\theta\right) \\
& \times \mathbb{P}\left(\left(X_{k}\right)_{0 \leq k \leq n}=\left(x_{k}\right)_{0 \leq k \leq n} \mid \Theta=\theta\right) \mathbb{P}(\Theta=\theta)
\end{aligned}
$$

(2) Propose a MCMC scheme in order to get a sample of the law $\mathbb{P}\left(\Theta \mid\left(Y_{k}\right)_{0 \leq k \leq n}=\left(y_{k}\right)_{0 \leq k \leq n}\right)$. You do not have to prove the convergence but you must specify the following.
(a) State space of your MCMC.
(b) Proposal kernel.
(c) Target law.

Exercise 2. We want to minimize

$$
H: z \in \mathbb{R}^{d} \mapsto-\sum_{k=1}^{d} y_{k} \log \left(z_{k}\right)
$$

where $d \in \mathbb{N}^{*}$ and $y_{1}, \ldots, y_{d}$ are fixed (in $\mathbb{R}^{+}$and such that $y_{1}+\cdots+y_{d}=1$ ). We want to do this minimization under the constrain

$$
z_{1} \geq 0, \ldots, z_{d} \geq 0 \text { and } z_{1}+\cdots+z_{d}=1
$$

We set $F(z)=z_{1}+\cdots+z_{d}$.
(1) Compute the gradient of $H$.
(2) Compute the gradient of $F$.
(3) Find a candidate for the minimum.
(4) Show that this candidate is an absolute minimum.
